Lutavit® B2 SG 80

Vitamin B2, is essential for healthy growth and development in both humans and animals. This vitamin plays a key role in the metabolism of proteins and fats and is used as an essential micronutrient in the nutrition of all species of livestock and companion animals. A deficiency in vitamin B2 can lead to slowed growth, inefficient nutrient absorption and issues such as diarrhea. In poultry, this deficiency is commonly associated with symptoms like abnormal inward bending of the toes.

Lutavit® B2 SG 80 from BASF is the only naturally produced vitamin B2, synthesized by the fungus *Ashbya Gossypii*. Through a proprietary fermentation process, plant-based oils are converted into vitamin B2, which is then carefully isolated, purified and dried. Its distinctive orange color is a testament to the exceptional purity and quality of Lutavit® B2 SG 80.
